

1. Normal **IntraMessenger** usage : many users connect to the web server, database can be on the server, or on a second one. Step A (red arrows) : check user already exist (and password good). If user not exist, he be created (if options). Step B (blue arrows) : messaging.

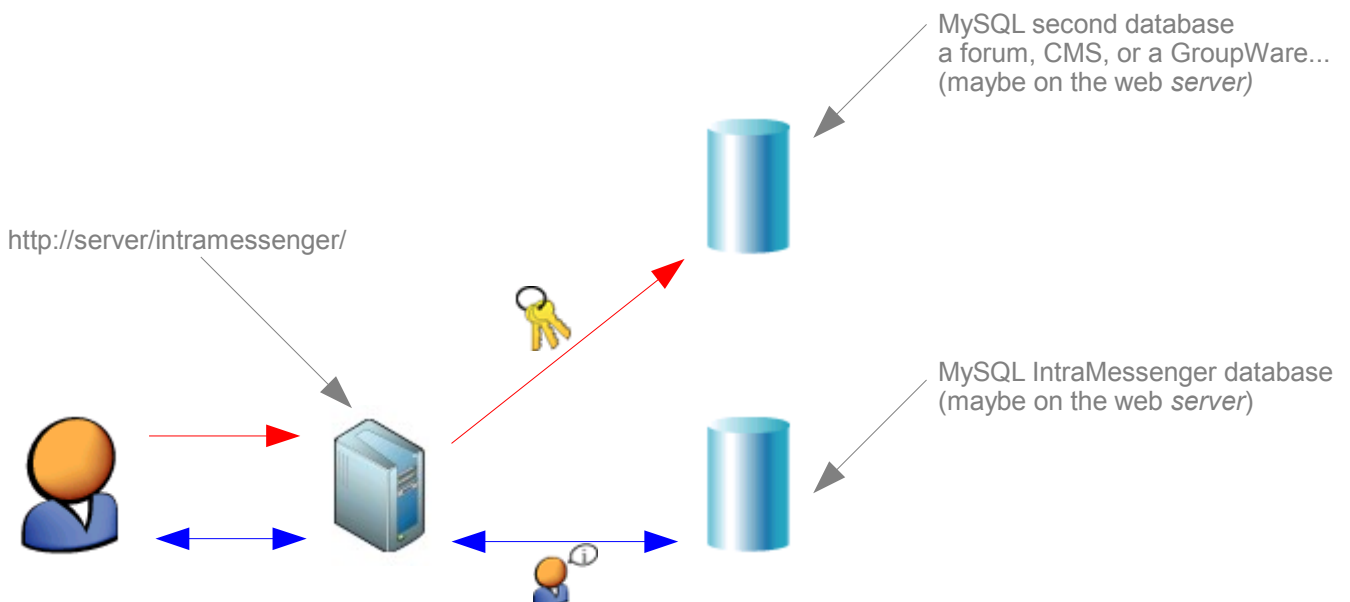

2. **IntraMessenger** with extern authentication (example : a forum).

Users connect to the web server, but must already exist in forum for authenticate.

Step A (red arrows) : check user already exist in extern database (and password good).

If user not exist, he rejected.

Messaging

Authentication

3. Using IntraMessenger by 2 different address (url)  
 Just for apply different options to users by adresse A or B.  
 Example : on server A, users can have 3 contacts, and can be only 50 simultaneous,  
 on server B, users can have 20 contacts, but can be 200 simultaneous

4. IntraMessenger with 2 extern authentication (example : a forum and a CMS),  
 better to not use this way (demo on : <http://www.intramessenger.net/tests/>)
